

Software for Construction Companies (PTSPI)

The software package for calculation of costs and monitoring of projects in performance is a relatively modern and advanced application, one of this type on the market, primarily for meeting the needs of the construction companies.

The package can be generally divided in three logical units:

- Calculation of the costs for a construction
- Monitoring of a construction
- Subcontractors
- Control over the materials consumed

Finally, we would like to note that Elikosoft with its team is available to all clients interested in any kind of information.

The main objectives achieved by the software solution for “Calculation of costs and monitoring of projects” are the following:

- Implementation of an integrated database for construction norms
- Application used for calculating the costs and monitoring projects in construction work

The software solution consists of the following fundamental components:

- Electronic record of construction projects
- Entry of positions in the project
- Calculations and accounts
- Monitoring of temporary situations and situations for subcontractors
- Control over the materials consumed (comparison of the calculated costs based on the calculations and the actual consumed quantities of materials based on the material management)

The applicative package serves for entry of positions in a project according to certain construction norms, carrying out calculations for the project according to amounts and time, keeping record of the consumed resources in the project, as well as keeping record of situations for tasks performed and situations for subcontractors.

The software meets the following requirements:

- Multi-tasking: system that is capable of performing more than one task simultaneously
- Graphic user’s interface
- Operations that are transparent and simple for usage

The software is simple for usage, it includes menus, masks for the display for logical interaction. The re-entry of data is minimized.

By using the latest advanced technologies and tools, the application facilitates web oriented access as well, whereby the user can access the data and find what he/she needs at a specific moment, anywhere and anytime.

The application provides a possibility for integration with finance – accounting applicative package which would result in complete integration by monitoring the costs of projects in the field of construction work, as well as independent functioning of the package without integrating it with a warehouse/material operating and without control over the resources.

This software is protected as a copyright product in the ownership of Elikosoft where by illegal copying is prohibited, the software is licensed and as such, it can be sold. The software is protected by the Law on copyrights, the international copyrights and other Laws on intellectual property.

Finally, we would like to state that Elikosoft is available together with its personnel for all interested subjects for any information.
